

Infrastructure that doesn't stop.

Technology for energy storage, electric mobility, digital signage and air purification — deployed by an integrator with regional presence.

The logo for Solum is the word 'SOLUM' in a bold, purple, sans-serif font.

BRANDS WE REPRESENT

Authorized distributor of Solum · Upcoming Easy Networks representatives for Latin America.

HEADQUARTERS

Mexico City

COVERAGE

Latin America

DOCUMENT

Commercial brochure · 2026

Distributor and integrator of Korean technology for Latin American critical infrastructure.

We operate as a full-cycle technology partner: project engineering, international supply, certified installation, preventive maintenance and remote monitoring. Headquartered in Mexico, with local teams across each market.

01

50-year Samsung legacy

Solum is a spin-off of Samsung Electro-Mechanics, carrying a legacy of more than 50 years in power and display electronics. Over 3,600 employees and USD 1.2 billion in revenue (2024).

02

Five plants in five countries

Owned production in Korea, Vietnam, India, China and Tijuana, Mexico. Supply-chain resilience independent of geopolitical origin.

03

Factory backing on site

On large-scale projects we include direct on-site oversight from a Solum technical representative. A level of backing that is rare in the Latin American integrator segment.

04

Validated by global industry

Solum power modules operate in Hyundai and Kia EV chargers. Labeling and picking technology in use by Amazon, Whole Foods, Lowe's and CAO Brazil (HYUNDAI / CHIREY / GEELY logistics).

WHY GRACENERGY

The honor of representing this legacy.

Bringing this technology to Latin America is a responsibility we take on with gratitude. Two of the founding partners are recognized industry leaders in the energy and hydrocarbons sector in Mexico and Latin America, with a track record built on integrity. A third lived close to twelve years in South Korea — graduate studies, work alongside the public sector, and regional experience across China, Singapore, Thailand, Indonesia and the Philippines. For our team, Korea and Asia are not distant geographies.

Four fronts of growing risk. Four operating-ready technology platforms.

Each vertical addresses an operational risk that is highly probable on the 2026–2030 horizon for commercial real estate, fuel stations, supermarkets, residential and smart-city developments. The technology we distribute is designed to mitigate them before they translate into loss.

Energy storage · ESS systems

RISK

Outages, peak-tariff exposure, weak integration of solar generation and rising regulatory pressure for decarbonization. Growing exposure for critical operations and real-estate assets.

Energy Storage Systems (ESS) scalable from 5.12 kWh residential to 760 kWh industrial. LFP cells delivering up to 8,000 cycles, UL9540, UL1973 and IEC62619 certifications. Applications: critical-operation backup, peak-demand management, integration with solar generation and microgrid architectures.

Fast charging · Electric vehicles

RISK

Accelerated electrification of commercial fleets, regulatory requirements for charging points in new developments and obsolescence risk for assets that fail to incorporate them.

DC chargers from 30 to 200 kW and AC inverters, with **Solum power modules** validated in Hyundai and Kia fleets. CCS, CHAdeMO and Type 2 connectors per market. Applications: fuel stations, commercial parking, logistics hubs, premium residential and smart-city developments.

Digital signage · Electronic labels + Commercial displays

RISK

Loss from pricing errors, rising cost of manual label updates, slow promotional response and disadvantage versus omnichannel competitors.

Electronic-paper labels (ESL) Newton Core and Core+, up to 10-year lifespan, monochrome and 4-color, with the **AIMS SaaS** platform for centralized management. **Commercial displays (Smart Signage)** from 1.5" to 82" (LCD, LED, OLED), indoor and outdoor, with secure encrypted updates.

Air purification · Large enclosed and semi-open spaces

RISK

Persistent urban pollution (PM2.5, PM0.3), health risk in high-traffic spaces and tightening indoor air-quality regulations.

ECOVER purifiers covering 100 to 1,200 m² per unit, BLDC motor for continuous operation, removal of >99% of viruses and bacteria, remote monitoring. Designed for schools, hospitals, metro stations, convention centers, arenas and other high-traffic venues.

Beyond reselling: full-cycle technology partners.

Our scope runs from upfront engineering to post-sale operation. We structure commercial models that adapt to each client's size, vertical and technology maturity.

Engineering and integration

Technical surveys, sizing, coverage design and site/region rollout planning.

International supply

Coordination with Solum plants in Korea, Vietnam, India, China and Mexico. International logistics, customs and warehousing.

Extended warranty and SLA

2-year factory warranty, extension up to 5 years. Safety stock for swap replacement.

On-site deployment

Certified installation, operational training and validation with factory representative on large projects.

Flexible models

Direct purchase, short and mid-term rental (events, pilots), rent-to-own and turnkey CapEx projects.

Continuous operation

Remote monitoring, preventive maintenance, corrective support and optional structured financing.

Commercial coverage: all of Latin America.

Incorporated in Mexico, with commercial and technical teams deployable across each market. We operate under the Double Taxation Treaties in force between Mexico and the main countries in the region. Standard payment structure: 40% upon contract signing, 40% upon customs-cleared delivery, 20% upon completion of the final project phase, secured with a sight letter of credit or equivalent collateral guarantee. Adjustable by project size and vertical.
